

Humanoid Service Robots & AI to Redefine Customer Engagement

By Asst.Prof. Supachai Vongbunyong, PhD - Director of FIBO@KMUTT

1. Overview of Humanoid & Trend
2. Technical Overview of Humanoid
3. User Experience & Standard
4. When to use or not to use ?
5. Humanoid and MAR Tech Ideas

“Futuristic humanoids working in homes, businesses, and public spaces fuel people’s interest. Since our environment is *optimized for the human body*, the idea of a quick, universal helper to maintain manufacturing and services is evident.”

“If and when a mass adoption of humanoids will take place remains uncertain, in any case, *humanoids are not expected to replace the types of robots currently on the market in the future*. Instead, they will complement and expand upon existing technology.”

Takayuki Ito, president of IFR (International Federation of Robotics)

Trend around the globe <https://www.therobotreport.com/ifr-examines-humanoid-adoption-trends-around-globe/>

1.2 Humanoids – Adoption Trend by Regions

US United States

- **Tech giants and startups** (e.g., NVIDIA, Amazon, Tesla) are heavily investing in humanoids.
- Focus: enhancing productivity in logistics and manufacturing—not social companionship

CN China

- Humanoids are a **national strategic priority**, supported by industrial policy and scalable supply chain initiatives.
- Emphasis: service industries like customer-facing roles, with manufacturing automation as a secondary goal

JP Japan

- **Pioneering history**: Honda's ASIMO in 2000 paved the way.
- Current humanoids (e.g. Pepper, Palro) serve primarily as **social companions** (education, retail, and elderly care).
- Cultural acceptance is higher due to demographic needs and societal attitudes toward robot companionship

EU Europe

- **Ethics and human-centric design** dominate.
- Preference for collaborative robots (cobots) in industrial environments over full humanoid deployment.
- Humanoids are seen more as a complement than a core automation tool

Trend around the globe <https://www.therobotreport.com/ifr-examines-humanoid-adoption-trends-around-globe/>

1.3 Trends of Humanoids – Market Share

Humanoid robots are expected to become a \$38 billion market by 2035

Forecast global humanoid robot market size (\$ billion)

Replay

Source: Goldman Sachs Research
High, mid, and low spec refer to robot sophistication, from basic functionality to state of the art.

Goldman Sachs

- *Goldman Sachs* projects the total addressable market (TAM) for humanoid robots will rise to US \$38 billion by 2035 (up more than sixfold from an initial estimate of US \$6 billion)
- Expected cumulative shipments by 2035: \approx 1.4 million units globally
- More affordable: Production cost per robot is anticipated to decline by \sim 40%, from \$50K–\$250K to \$30K–\$150K, speeding commercial adoption

1.4 Trends of Humanoids - Summary

- Initial **market dominance** lies in “*Industrial sectors*”. Consumer-focused applications are expected to expand only in the latter half of the decade
- **Current barriers**: Battery life (~2-3hr), Limited combination of physical and cognitive ability, Safety standard, High complexity, and Reliability.
Mass adoption: not soon, expected in 5-10 years.
- **The overall ecosystem positions** China as a manufacturing center (supported by governmental funding and component supply chains), with **US/Europe leading on AI software innovation**, shaping global market share distribution toward 2035.

Trend around the globe <https://www.therobotreport.com/ifr-examines-humanoid-adoption-trends-around-globe/>

<https://www.goldmansachs.com/insights/articles/the-global-market-for-robots-could-reach-38-billion-by-2035>

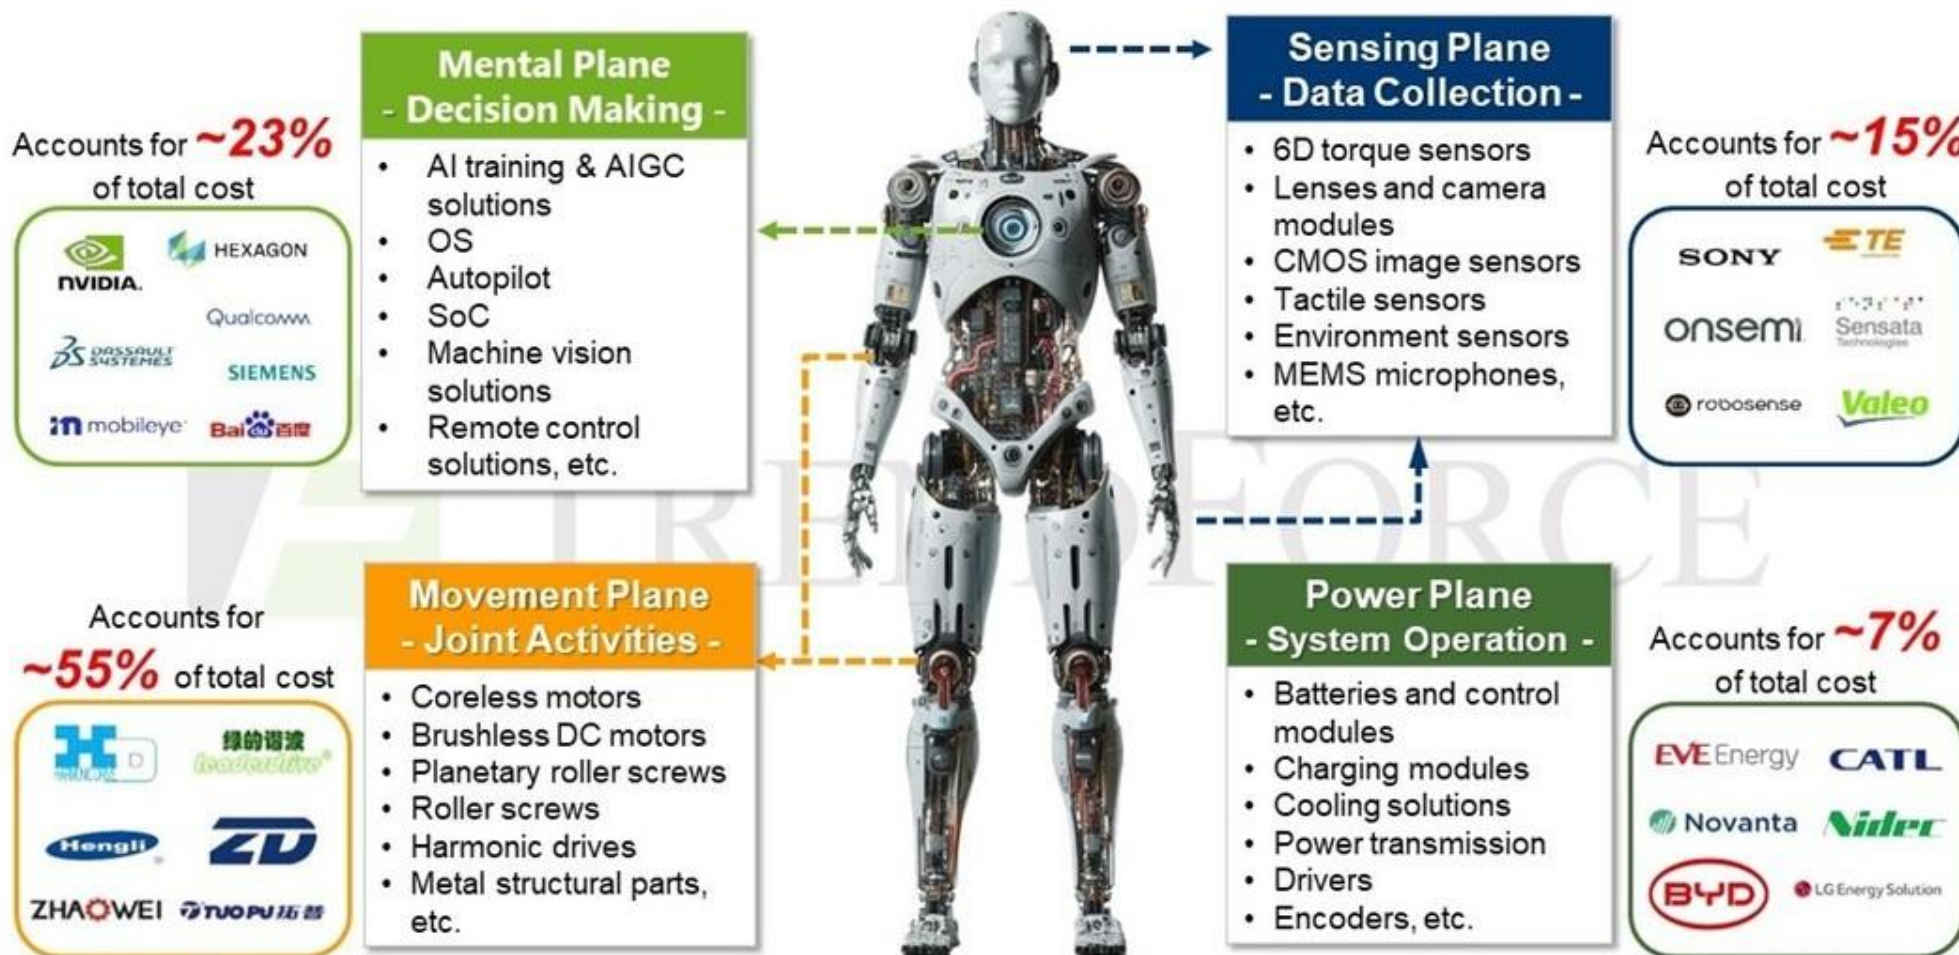

A **humanoid** is a machine built to *look like, move like*, and *interact like a human*, enabling it to operate in spaces and perform tasks originally designed for people.

- **Physical structure:** Typically features a torso, head, two arms, and two legs (or at least an upper body with human-like features).
- **Mobility:** Can walk or move in ways similar to humans (bipedal locomotion, arm movements, grasping).
- **Sensing and interaction:** Equipped with sensors to perceive the environment and interact naturally with humans.
- **Human-centered design:** Intended to work in human environments, use human tools, and communicate naturally with people.

2.2 Key Components

Humanoid Robots – Key Components and Potential Suppliers Worldwide

DUGA ROBOTICS SUMMIT

Use humanoids where being “human-like” matters
(interaction, environments designed for people, branding).

Avoid humanoids where efficiency matters more than human form
(industry, logistics, heavy work)

Wheeled Robots

Legged-Wheel Robots

Legged Robots

3.3 Why Using Humanoids Instead of Other Types of Robots ?

Slide 14

Dimension	Humanoid	Other Robots (wheeled, arms, drones, etc.)
Adaptability	High – can use human tools, move in human spaces	Usually low – designed for specific tasks
Human interaction	Natural, intuitive	Requires training or indirect interfaces
Infrastructure	No major change needed	May need redesign (e.g., AGVs need special paths)
Cost & Complexity	High	Lower
Efficiency	Moderate (generalist)	High (specialist)
Emotional/PR impact	Very high	Low–moderate

With consideration of economically feasibility

Humanoids can be economically feasible in:

- ✓ **Niche roles** where human-like interaction is valuable
- ✓ **Environments** that are already human-centric and unstructured
- ✓ **High-labor-cost** or labor-shortage sectors (e.g., Japan, Europe)
But in many areas, non-humanoid robots (wheeled, industrial arms, etc.) still offer better ROI due to lower complexity and cost.

1. Customer Service in Retail / Hospitality

- **Tasks:** Greeting customers, answering basic inquiries, guiding to product locations, simple check-in/check-out.
- **Examples:**
 - SoftBank's **Pepper** in stores and malls.
 - Hanson Robotics' **Sophia** as a brand ambassador.
- **Feasibility:** Can be cost-effective in flagship or high-traffic locations where brand experience matters more than ROI per task.

2. Reception / Front Desk Automation

- **Tasks:** Visitor registration, queue management, wayfinding, ID verification.
- **Examples:** Humanoid robots used in hotels (e.g., **Henn-na Hotel** in Japan).
- **Feasibility:** Helps reduce long-term labor costs in high-wage countries and operates 24/7.

3. Elderly Care / Social Companionship

- **Tasks:** Conversation, reminders for medication, physical and cognitive activity prompts, fall detection.
- **Examples:**
 - **PARO** (not humanoid but relevant),
 - **Tem i** and similar companion robots.
- **Feasibility:** High potential in aging societies (Japan, South Korea, EU) where caregiver shortages are critical.

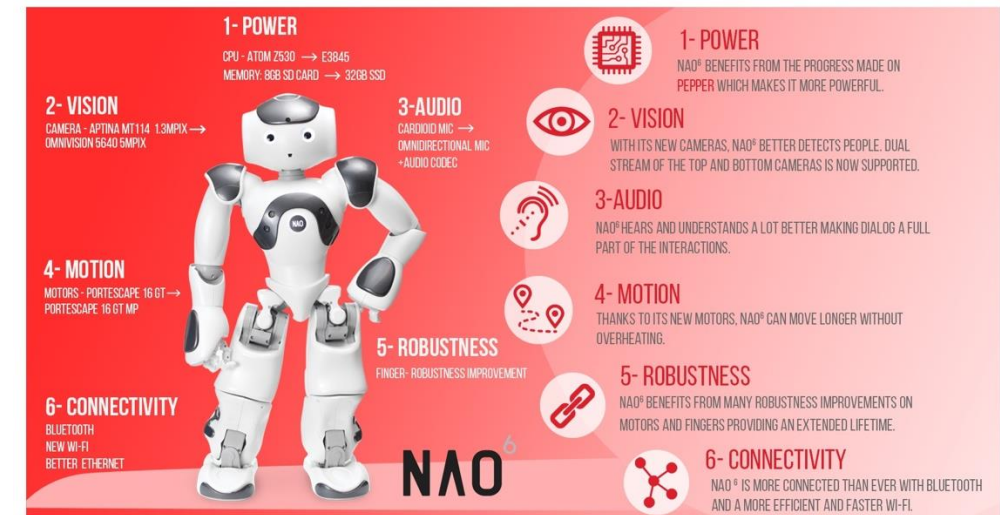

5. Laboratory / Healthcare Assistance (Limited Use Cases)

- **Tasks:** Transporting samples, delivering medicines, fetching supplies in hospital or lab settings.
- **Examples:** Custom humanoid platforms in smart hospitals.
- **Feasibility:** Mostly used in pilot projects or high-tech hospitals; not yet widely adopted due to cost and regulation.

4. Education and STEM Engagement

- **Tasks:** Teaching assistant, interactive tutor, storytelling, coding education.
- **Examples:**
 - **NAO** robots used in classrooms for autistic children or language learning.
- **Feasibility:** Viable in premium education or special needs schools. Useful as an engagement tool more than a full teaching replacement.

6. Manufacturing Support (Where Human Form Helps)

- **Tasks:** Tool delivery, manual switch pressing, tasks in human-centric workspaces.
- **Examples:**
 - **Tesla's Optimus** and **Figure AI's humanoid** are aiming here.
- **Feasibility:** Only becomes economical **if the robot can multitask** in dynamic environments and use existing infrastructure (vs. reprogramming or rebuilding).

7. Logistics – Warehouse & Factory Inspection

- **Tasks:** Navigating human-designed environments to inspect, fetch items, report anomalies.
- **Examples:** Humanoids climbing stairs, lifting boxes in Amazon-style warehouses.
- **Feasibility:** Still developing; currently, mobile wheeled robots (like AMRs) are more cost-effective.

Require **too much dexterity, safety, power, or cost** to be feasible today.

- General-purpose housework (vacuuming, dishwashing, laundry folding)
- Complex caregiving (feeding, bathing)
- Construction labor
- Cooking in dynamic kitchens
- Security enforcement

Factor

Comment

Cost vs. Labor Saving

Most humanoids are \$50K–\$200K+, which takes years to recover unless ROI is clear.

Environment Adaptation

Humans work in messy, unstructured environments; robots still struggle.

Safety and Regulation

Especially critical in healthcare, education, and hospitality.

Maintenance & Downtime

Robots need regular software/hardware updates and repairs.

Humanoid + MAR Tech (Marketing Technology) makes sense when:

- You want **differentiated customer experience**
- You're in **high-margin industries** (luxury, health, education, tourism)
- The robot is **multi-functional**: entertainment + lead generation + data collection
- It's part of a **larger marketing campaign** with measurable KPIs

Challenge

Impact

High Initial Cost

\$50K–\$200K+ per unit — only viable if ROI from engagement/lead generation is high.

Maintenance & Downtime

Requires technical staff or service plan.

Novelty Wears Off

Without regular updates, engagement may drop after novelty fades.

Privacy & Compliance

Data collection via humanoids must comply with laws (GDPR, PDPA, etc.).

Space & Power Needs

Humanoids often require flat surfaces, stable WiFi, and charging stations.

1. Experiential Marketing / Brand Activation

- **Use Case:** Humanoids act as *brand ambassadors* in stores, events, or expos to attract attention, deliver messages, and offer interactive experiences.
- **Tech Stack:**
 - Facial recognition → demographic segmentation
 - Emotion detection → personalized messages
 - Voice interaction + NLP → brand storytelling
- **Economic Justification:**
 - Works well in **high-traffic retail** or **flagship events** where customer engagement has high ROI.
 - Adds novelty and PR value.
- **Example:** A cosmetics brand deploying a humanoid to scan skin and recommend products using AI.

2. Data Collection & Real-Time Customer Insights

- **Use Case:** Humanoids interacting with customers can collect:
 - Foot traffic metrics
 - Engagement duration
 - Product interest and feedback
- **MAR Tech Integration:**
 - CRM systems (e.g., Salesforce)
 - Analytics dashboards
 - A/B testing for interaction models
- **Feasibility:** Medium — depends on volume of data and scale of deployment.

3. Interactive Surveys and Lead Generation

- **Use Case:** At trade shows or airports, humanoids can:
 - Engage passersby with questions
 - Collect contact info (name, email)
 - Promote product trials or demos
- **Feasibility:** Effective for industries like insurance, banking, and healthcare where **leads are valuable** and conversion is trackable.

4. Retail Personalization

- **Use Case:** In physical retail, a humanoid can:
 - Greet customers by name
 - Recommend products based on previous visits (via loyalty program integration)
 - Offer promotions or personalized coupons
- **MAR Tech Components:**
 - Loyalty platforms
 - POS integration
 - Customer segmentation engines
- **Feasibility:** Higher in luxury or boutique retail where the **customer lifetime value** is high enough to justify the cost.

5. Digital Signage & Voice-Controlled Displays

- **Use Case:** Humanoid robots acting as smart kiosks or signage that respond to voice or gesture.
- **Enhancement with MAR Tech:**
 - Targeted ads based on user profile
 - Real-time content adjustment
- **Feasibility:** More viable than passive signage in environments like shopping malls, tech stores, or tourist hubs.

4. Retail Personalization

- **Use Case:** In physical retail, a humanoid can:
 - Greet customers by name
 - Recommend products based on previous visits (via loyalty program integration)
 - Offer promotions or personalized coupons
- **MAR Tech Components:**
 - Loyalty platforms
 - POS integration
 - Customer segmentation engines
- **Feasibility:** Higher in luxury or boutique retail where the **customer lifetime value** is high enough to justify the cost.

5. Digital Signage & Voice-Controlled Displays

- **Use Case:** Humanoid robots acting as smart kiosks or signage that respond to voice or gesture.
- **Enhancement with MAR Tech:**
 - Targeted ads based on user profile
 - Real-time content adjustment
- **Feasibility:** More viable than passive signage in environments like shopping malls, tech stores, or tourist hubs.
